Abstract:
This research is intended to understand description of religious orientation of the community. The basic concept of religious orientation used in this research came from Allport and Ross. The religious orientation is measured using Allport-Ross (AROS) measuring device which had been used by Mohammad and Ginting. It consisting of 20 opinions conducted with a Likert typed scale. There were 157 participants joined in this research. The average of intrinsic value of religious orientation from the group of participants is 4,48 with SD grade of 0,65. Furthermore, average value of population is also found to be approximately 0f 4,38 to 4,59 with 95% l.o.s. if the result of intrinsic religious orientation average is included in table 2, then the result of its intrinsic religious orientation is considered to be high. Meanwhile, the average of extrinsic religious orientation from the participants is 3,30 with SD value of 0,85 and the population average value of approximately between 3,17 to 3,43 with 95% l.os. Such outcome if adjusted with table of category then extrinsic religious orientation of the community is rated low.

Key word: religious orientation, extrinsic religious orientation, intrinsic religious orientation, indiscriminate proreligious.
